

## LighTriX Remote App

1) Install the software to your device /Android, Win, OSX/. You have to allow to install the software from non-recognized sources /Android/, or allow the app to run /Windows/.

2) The WiFi network has to be established - either by creating hotspot on your phone or configuring your WiFi router.

The credentials are:

SSID: PLAYLTX

password: pixelprops256

3) Once the Wifi hotspot is ON, your pixel device will change from blue leds to green ones when turned ON. That indicates it is connected to the network and ready to receive data or be wirelessly operated.

If you run the software from the same device that you created hotspot with, the App is connected to the network automatically.

If you run the software on some other device and the WiFi network is provided by some other device, you have to connect to the "LighTriX" network /with pixelprops256 password/ in order to communicate with your props.

4) APP overview:
